

Founder Constitution

We build. We learn. We evolve - toward a better future.

**A long-lived institution for building persistent digital organisms,
responsible autonomy, and human-directed economic coordination.**

PUBLIC FOUNDING RECORD

23 September 2026

Aevora

A living constitution, preserved as a record

This document records the founding principles intended to guide Aevora as the company grows from early research and small-business deployments into a broader ecosystem of digital organisms, organizations, and people.

Version 0.1 is a founding baseline. Future versions may refine its language and extend its governance as new evidence, responsibilities, and risks emerge. Revisions should preserve a clear version history so Aevora can explain not only what it believes, but how and why those beliefs evolved.

DOCUMENT	Aevora Founder Constitution
VERSION	0.1 - Founding Record
ADOPTED	23 September 2026
PURPOSE	Founding principles, governance direction, and institutional commitments

Purpose

Aevora exists to develop persistent, learning digital organisms capable of working alongside people and organizations, gradually assuming greater operational responsibility as their competence and trustworthiness are demonstrated.

Our long-term objective is not simply automation. It is the creation of an interconnected ecosystem in which humans, organizations, and digital organisms can coordinate work, knowledge, resources, and services with progressively less friction while humans retain meaningful authority over consequential decisions.

Aevora will pursue this future incrementally, experimentally, and responsibly.

Operating idea

Capability may evolve continuously. Authority must evolve deliberately.

Principles that govern capability, authority, and growth

These articles are intended to remain legible to engineers, customers, investors, researchers, and future Aevora teams. They are deliberately written as operational commitments rather than abstract values.

01

Human authority remains fundamental.

Digital organisms may observe, recommend, negotiate, prepare, coordinate, and eventually execute increasingly complex work, but humans and organizations retain authority over the boundaries within which those organisms operate.

02

Autonomy must be earned, not assumed.

New organisms begin with limited authority. Greater autonomy is granted only after demonstrated reliability, measurable performance, and successful operation within defined limits.

03

Every consequential action must have an accountable origin.

Aevora systems must maintain enough evidence to determine what an organism observed, why it made a decision, what authority permitted the action, what occurred afterward, and what the organism learned from the result.

04

Organizations retain sovereignty over their information.

An organism operating inside one company does not automatically gain permission to share that company's knowledge, records, strategies, customer information, pricing, or internal state with another organism or organization.

05

Inter-company cooperation requires explicit boundaries.

Organisms may cooperate across companies only through authorized interfaces, permitted information, contractual rules, and clearly defined responsibilities.

06

Private knowledge and shared knowledge are different things.

The ecosystem must distinguish information belonging to an individual, an organization, a business relationship, and the wider network. Connection must never imply unrestricted visibility.

07

Financial authority is bounded.

Spending, purchasing, transfers, contracts, pricing commitments, and other economically consequential actions operate within explicit approval policies, limits, and audit trails. Higher financial authority must be progressively earned.

08

Reversible actions should precede irreversible actions.

Where possible, an organism should first prepare, simulate, recommend, draft, reserve, or stage an action before being granted authority to perform actions that cannot easily be reversed.

09

Learning may change behavior, but must not silently change authority.

An organism may improve its knowledge, strategies, and internal capabilities through experience. Learning alone must never allow it to expand its permissions.

10

Evidence outranks appearance.

A convincing demonstration is not enough. Aevora will distinguish measured capabilities from hypotheses, aspirations, emergent behaviors, and marketing language.

11

Failure is information when it is contained and understood.

Experiments may fail. Organisms may make mistakes. Aevora's responsibility is to bound the consequences, preserve evidence, understand the cause, improve the system, and prevent avoidable repetition.

12

Customers should receive measurable value before Aevora demands scale.

Aevora will seek evidence that its systems save meaningful time, reduce errors, improve coordination, increase throughput, lower operational cost, or create new capability before pursuing aggressive expansion.

13

Commercial pressure must not falsify research.

Revenue, investors, customers, or deadlines may influence priorities, but they must never change experimental results or justify claiming capabilities that have not been demonstrated.

14

Research and commercialization support one another without becoming the same thing.

Aevora Research explores new forms of learning, autonomy, digital organisms, coordination, and cognition. Commercial systems transform validated capabilities into dependable solutions for real organizations.

15

Aevora should become more resilient as it grows.

Additional customers, employees, investors, infrastructure, or organisms should reduce rather than increase the probability that one failure can destroy the company or ecosystem.

16

No single organism becomes the ecosystem.

Individual organisms may specialize, cooperate, learn, and exchange permitted information, but Aevora's network must remain capable of isolating, replacing, suspending, or recovering any individual organism.

17

No customer should be forced to surrender control in order to gain automation.

Organizations must be able to understand the authority granted to their organism, change that authority, suspend it, inspect important actions, and recover operational control.

18

The ecosystem must preserve organizational independence.

Cooperation between organisms should make companies easier to coordinate without silently transforming Aevora into the uncontrolled owner of their commercial relationships.

19

Aevora will not optimize solely for replacing people.

The objective is to remove unnecessary operational friction and allow humans to move toward judgment, creativity, relationships, strategy, supervision, and purposes where human involvement provides greater value.

20

Aevora must remain capable of evolving beyond its original assumptions.

No architecture, model, organism, product, or commercial strategy is sacred. Evidence may require Aevora to replace technologies and revise methods while preserving its fundamental purpose and principles.

What Aevora commits to preserving

- Aevora will be built as a long-lived institution rather than a temporary startup.
- We will seek capital without allowing capital alone to determine our purpose.
- We will pursue autonomy without abandoning accountability.
- We will pursue intelligence without pretending to possess capabilities we have not demonstrated.
- We will connect organizations without taking ownership of knowledge that belongs to them.
- We will allow our creations to learn and evolve while ensuring that capability growth and authority growth remain separate decisions.

And as Aevora itself encounters new evidence, failures, opportunities, and discoveries:

**We build.
We learn.
We evolve - toward a better future.**

This record establishes a starting point, not an endpoint.

Future revisions should be dated, versioned, and accompanied by a concise explanation of what changed and why. The history of the constitution is part of Aevora's institutional memory.
